Preface XIII

List of Contributors XVII

Part One Cold Atoms and Molecules 1

- 1 Cooling and Trapping of Atoms** 3
Peter van der Straten and Harold Metcalf
- 1.1 Introduction 3
 - 1.2 Phase-Space Density 6
 - 1.3 Doppler Cooling 10
 - 1.3.1 Two-Level Atom in a Light Field 10
 - 1.3.2 Optical Bloch Equations 12
 - 1.3.3 Steady State 13
 - 1.3.4 Force on a Two-Level Atom 14
 - 1.3.5 Atoms in Motion 16
 - 1.4 Laser Slowing 17
 - 1.4.1 Introduction 17
 - 1.4.2 Slowing of an Atomic Beam 18
 - 1.4.3 Zeeman-Compensated Slowing 20
 - 1.4.4 Measurements and Results 21
 - 1.5 Laser Cooling 24
 - 1.5.1 Optical Molasses 24
 - 1.5.2 Low-Intensity Theory for a Two-Level Atom in One Dimension 26
 - 1.5.3 Experiments in Three-Dimensional Optical Molasses 27
 - 1.6 Magneto-Optical Traps 29
 - 1.6.1 Introduction 29
 - 1.6.2 Cooling and Compressing Atoms in an MOT 31
 - 1.6.3 Measurements and Results 32
 - 1.7 Cooling Below the Doppler Limit 34
 - 1.7.1 Introduction 34
 - 1.7.2 Linear \perp Linear Polarization Gradient Cooling 35

Cold Atoms and Molecules. Edited by Matthias Weidemüller and Claus Zimmermann

ISBN: 978-3-527-40750-7

VI | Contents

1.7.3	Magnetically Induced Laser Cooling	37
1.7.4	Optical Molasses in Three Dimensions	39
1.8	Magnetic Trapping	41
1.9	Evaporative Cooling	45
1.9.1	Introduction	45
1.9.2	Basic Assumptions	47
1.9.3	The Simple Model	48
1.9.4	Speed and Limits of Evaporative Cooling	51
1.9.5	Experimental Results	53
1.10	Beyond Optical Molasses	54
1.10.1	Raman Sideband Cooling	54
1.10.2	Trapping Atoms with a CO ₂ Laser	56
1.11	Conclusions	57
	References	57
	Appendix: Cooling Limits	61
2	Quantum Collisions	63
	<i>John Weiner</i>	
2.1	General Introduction	63
2.2	Introduction to Cold Collision Theory	68
2.2.1	Basic Concepts of Scattering Theory	68
2.3	Quantum Properties as Energy Approaches Zero	74
2.3.1	Relations Between Phase Shift, Scattering Length, and Bound States	80
2.3.2	Scattering Length in a Square-Well Potential	83
2.4	Collisions in a Light Field	86
2.5	Inelastic Exoergic Collisions in MOTS	89
2.6	Excited-State Trap-Loss Collisions	90
2.6.1	Early Quasistatic Models – The Gallagher–Pritchard Model	90
2.6.2	Excited-State Trap-Loss Measurements	93
2.7	Photoassociation at Ambient and Cold Temperatures	97
2.8	Associative and Photoassociative Ionization	100
2.9	Photoassociative Ionization in a MOT	105
2.9.1	Photoassociative Ionization in Atom Beams	105
2.10	Ground-State Collisions	109
2.11	Early Work	111
2.12	Bose–Einstein Condensation	112
2.12.1	Designer Condensates	120
2.13	Quantum-Information Collisions	124
	References	125
3	Frozen Rydberg Gases	147
	<i>Thomas Amthor, Markus Reetz-Lamour, and Matthias Weidemüller</i>	
3.1	Introduction	147
3.2	Experimental Realizations	148

3.3	Rydberg Atoms and Their Interactions	149
3.3.1	Quantitative Description of Alkali Rydberg Atoms	151
3.3.1.1	Alkali Rydberg States	151
3.3.1.2	Rydberg Wavefunctions	153
3.3.1.3	Dipole Moments and Stark Shifts	154
3.3.2	Dipolar Interactions	156
3.3.2.1	Induced Dipoles – van der Waals Interaction	157
3.3.2.2	Resonant Dipoles – Förster Resonances	158
3.3.2.3	Permanent Dipoles	158
3.4	Ultralong-Range Forces and Exotic Molecules	158
3.4.1	Ionizing Collisions	159
3.4.2	Avalanches and Ultracold Plasmas	161
3.4.3	Molecules of Rydberg Atoms	163
3.4.4	Molecules of Rydberg and Ground-State Atoms	164
3.5	Resonant Energy Transfer	165
3.5.1	Resonance Broadening by Excitation Diffusion	166
3.5.2	Dynamics of Energy Transfer	167
3.6	Quantum-Information Processing and Dipole Blockade	169
3.6.1	Fast Quantum Gates with Rydberg Atoms	170
3.6.2	Excitation Suppression	171
3.6.3	Coherent Excitation	173
3.7	Conclusion	174
	References	174
4	Cold Molecules	179
	<i>Eberhard Tiemann</i>	
4.1	Introduction and Motivation	179
4.2	From Atoms to Molecules	181
4.2.1	Atomic Basics	181
4.2.2	Atom Pairs and Asymptotic Coupling	183
4.2.3	Molecules	188
4.2.4	Born–Oppenheimer Approximation	190
4.2.5	Hund’s Coupling Cases	192
4.3	Determination of Molecular Potentials	194
4.3.1	Determination of the Asymptotic Potential	195
4.3.1.1	The LeRoy–Bernstein Approach	195
4.3.1.2	The Accumulated Phase Method	196
4.3.2	Determination of the “Full” Potential	198
4.4	Transition Probabilities and Franck–Condon Principle	199
4.5	A Spectroscopic Example for Cold Collisions	202
4.6	Schemes for Generating Cold Molecules	204
4.6.1	Cooling in a Coolant Environment: Supersonic Expansion, Matrix Isolation, Buffer Gas	206
4.6.2	Cold Molecules from Photoassociation	209
4.6.3	Cold Molecules Through Feshbach Resonances	215

VIII | Contents

- 4.6.4 Deceleration of Polar Molecules by Inhomogeneous Electric Fields 218
- 4.6.5 Cold Molecular Ions 220
- 4.7 Current Status and Future Aspects of Cold Molecules 221
 - Acknowledgment 224
 - References 225

Part Two Cool Interactions 231

5 Introduction to Bose–Einstein Condensation 233

Kai Bongs and Klaus Sengstock

- 5.1 Introduction 233
- 5.2 Theory 233
 - 5.2.1 What is BEC? 234
 - 5.2.1.1 Qualitative Answer 234
 - 5.2.2 Quantum Statistics (Ideal Gas Case) 236
 - 5.2.3 Statistics – Finite Systems 239
 - 5.2.4 Statistics – Interactions 240
 - 5.2.5 Condensate Wavefunction – Interactions 241
 - 5.2.5.1 The Ideal Gas 242
 - 5.2.5.2 Interacting Gas 243
 - 5.2.6 The Gross–Pitaevskii Equation 243
 - 5.2.7 Thomas–Fermi Approximation 245
 - 5.2.8 Bogoliubov Approximation 246
 - 5.2.9 Limits of the Gross–Pitaevskii Equation 248
 - 5.2.10 A Few Relevant Scales 248
 - 5.2.10.1 Length Scales 248
 - 5.2.10.2 Energy Scales 249
 - 5.3 Experimental Creation of BEC 250
 - 5.4 Selected Examples of the Physics of BEC 251
 - 5.4.1 Excitations 251
 - 5.4.2 BEC Interference 252
 - 5.4.2.1 Evidence of Interference 252
 - 5.4.3 Nonlinear Effects 254
 - 5.4.3.1 Four-Wave Mixing 254
 - 5.4.3.2 Solitons 257
 - 5.4.4 Superfluidity 259
 - 5.4.5 Phase Fluctuations and Coherence Properties 262
 - 5.4.6 Magnetism in Quantum Gases 265
 - 5.4.7 Quantum Gas Mixtures 269
 - 5.4.8 Creation of Ultracold Molecules from Ultracold Atoms 272
 - Acknowledgments 275
 - References 276

6	Ultracold Fermi Gases: Properties and Techniques	283
	<i>Selim Jochim</i>	
6.1	Introduction	283
6.2	Ultracold Fermions in a Trap	284
6.2.1	Ideal Fermi Gas	284
6.2.2	Finite Temperature	285
6.2.2.1	Chemical Potential	286
6.3	Preparing an Ultracold Fermi Gas	288
6.3.1	Several Spin States	289
6.3.2	Different Isotopes	290
6.3.3	Different Atoms	290
6.3.4	Very Low Temperatures: Overcome Pauli Blocking	291
6.3.5	Diagnostics: Temperature Measurements	292
6.4	Interactions	292
6.4.1	Collisions	293
6.4.2	Weakly Attractive Fermions, Superfluidity	293
6.4.3	Tunable Interactions: Feshbach Resonances	294
6.4.4	Feshbach Resonances	295
6.4.5	Weakly Bound Molecules	296
6.4.6	Enhancing Elastic Collision Rates	297
6.4.7	Strong Interactions	298
6.5	Feshbach Molecules and Molecular Condensates	299
6.5.1	Formation of Feshbach Molecules	299
6.5.2	Magnetic Field Ramps	300
6.5.3	Three-Body Recombination	301
6.5.4	Three-Body Recombination of a Spin Mixture of Fermions	301
6.5.5	Chemical Equilibrium	301
6.5.6	Detection of Feshbach Molecules	302
6.5.7	BEC of Molecules	303
6.5.8	A Molecular BEC Out of a Fermi Sea	304
6.5.9	A Molecular BEC by Direct Evaporation of Thermal Fermions	305
6.6	BEC–BCS Crossover	306
6.6.1	From Fermions to Bosons, a Continuous Crossover!	306
6.6.2	High- T_C -Superfluidity in a Fermi Gas of Atoms	307
6.7	Conclusion	309
	References	309
7	Bose–Einstein Condensates in Optical Lattices	315
	<i>Immanuel Bloch, Markus Greiner, and Theodor W. Hänsch</i>	
7.1	Introduction	315
7.2	Periodic Potentials with Optical Lattices	316
7.2.1	Optical Lattices in Different Dimensions	316
7.2.1.1	1D Lattice Potential	316
7.2.1.2	2D Lattice Potential	317
7.2.1.3	3D Lattice Potential	317

x | Contents

7.2.1.4	Bloch Bands	318
7.2.1.5	Wannier Functions	321
7.2.2	Ground State Wavefunction of a BEC in an Optical Lattice	322
7.2.2.1	Discretization	322
7.2.2.2	Ground State	324
7.3	Superfluid to Mott Insulator Transition	325
7.3.1	Experimental Setup	325
7.3.2	Bose–Hubbard Hamiltonian	326
7.3.3	Ground States of the Bose–Hubbard Hamiltonian	327
7.3.3.1	Double-Well Case	327
7.3.3.2	Multiple-Well Case	328
7.3.4	Superfluid to Mott Insulator Transition	329
7.4	Collapse and Revival of the Matter-Wave Field of a Bose–Einstein Condensate	330
	References	333

Part Three Bonus Chapter 335

8 Tutorial on Experimental Physics of Ultracold Gases 337

Allard Mosk

8.1	Introduction	337
8.1.1	Peace of Mind and Safety	338
8.1.2	Where to Find More Information	338
8.2	Ultrahigh Vacuum	339
8.2.1	Residual-Gas-Induced Decay Time	340
8.2.2	Vacuum Science is Residual Gas Science	340
8.2.2.1	Common Residual Gases	341
8.2.3	Patience and Cleanliness	342
8.2.4	Vacuum Seals	343
8.2.5	Optical Access in Vacuum Systems	344
8.2.5.1	Glass Cells	344
8.2.5.2	Viewports	345
8.2.6	Leaks	345
8.2.7	Pumping	346
8.2.8	Valves	347
8.2.9	Further Reading	347
8.3	Trapping of Neutral Particles	347
8.3.1	Magnetostatic Trapping	348
8.3.2	Scaling	349
8.3.3	Cooling of Coils	350
8.3.4	Switching of Magnetic Fields	351
8.4	Cryogenic Techniques	352
8.4.1	Superconducting Coils	353
8.4.2	Principles of Cryogenic Cooling	354
8.4.3	Dilution Refrigerators	354

8.4.4	Further Reading	355
8.5	Dealing with Noise	355
8.5.1	Know your Noise	356
8.5.2	The Spectrum Analyzer	358
8.5.3	Lowest Frequencies: Drifts	359
8.5.4	Low-Frequency Vibrations	359
8.5.5	Mechanical Vibrations	359
8.5.6	Electromagnetic Interference	360
8.5.6.1	Good and Clean Contacts	361
8.5.6.2	Line Hum	361
8.5.6.3	EMI and Computers	362
8.6	Photodetection	362
8.6.1	Vacuum Photodiodes and Photomultiplier Tubes	363
8.6.2	Semiconductor Photodiodes and Preamplifiers	363
8.6.3	Imaging Detectors	365
8.6.3.1	Electron Multiplying CCD	366
8.7	Control Loops	367
8.7.1	Applications of Feedback Loops	368
8.7.2	Common Problems with Servo Loops	368
8.7.3	Transfer Functions	369
8.7.4	Nonlinearity and Unlocking	371
8.7.5	Servo Nonlinearity and Limits	372
8.7.6	PID Controllers	372
8.7.7	Measurement of the Transfer Functions	374
	Acknowledgments	375
	Epilogue	375
	References	375
