Preface IX

1	Introduction	1
1.1	Topics covered	1
1.2	Outline of the book	3
2	Formulation of Physical Problems	7
2.1	Forming fields of a given structure	9
2.1.1	Optimization of beam power transmission lines	9
2.1.2	Multi-element phase field transformers	14
2.2	Antenna synthesis problems	17
2.2.1	Synthesis of aperture antennas by amplitude radiation pattern	17
2.2.2	Synthesis of antenna arrays by amplitude radiation pattern	20
2.2.3	Multi-element beam transformers	24
2.2.4	Cavity resonant antennas	31
2.3	Phase optimization problems in waveguides and open resonators	34
2.3.1	Waveguide mode convertors	34
2.3.2	Minimization of losses in waveguide walls	36
2.3.3	Mirror shape optimization in a quasi-optical resonator	38
3	Mathematical Formulation of the Problems	41
3.1	Variational problems with no amplitude-phase restrictions on the required functions	42
3.1.1	Problem formulation	43
3.1.2	Reducing to the Lagrange–Euler equation	43
3.1.3	Stability of the functional	45
3.1.4	Alternative formulation	47
3.1.5	The case for an isometric operator	48
3.1.5.1	The Lagrange–Euler equation	48
3.1.5.2	Stability of minimizing sequences	49
3.1.5.3	The iterative method	51
3.1.6	Particular cases of the isometric operator	52
3.1.6.1	The Fourier transform	52
3.1.6.2	The discrete Fourier transform	53

3.1.6.3	The Hankel transform	54
3.1.7	Branching of solutions	55
3.1.8	The case of a compact operator	57
3.1.8.1	Problem formulation	57
3.1.8.2	The Lagrange–Euler equation	57
3.1.8.3	The stability of minimizing sequences	58
3.1.8.4	The iterative method	59
3.1.8.5	The particular case of the compact operator	60
3.1.8.6	Condition for equality of the norms	61
3.2	Variational problems with amplitude-phase restrictions on the required function	63
3.2.1	The phase optimization problem. The general case	63
3.2.1.1	The Lagrange–Euler equation	64
3.2.1.2	Branching of solutions	65
3.2.2	The phase optimization problem. A simplified alternative formulation	66
3.2.2.1	The Lagrange–Euler equations	66
3.2.2.2	Branching of solutions	69
3.2.2.3	The multi-operator phase optimization problem. The case of one-type operators	71
3.2.2.4	The multi-operator phase optimization problem. The case of double-type operators	76
3.2.3	The amplitude optimization problem	82
3.2.3.1	The general case	82
3.2.3.2	The case of a compact operator	84
3.2.3.3	The case of an isometric operator	85
3.3	Homogeneous optimization problems	86
3.3.1	Problems of energy concentration	86
3.3.1.1	Amplitude-phase optimization	86
3.3.1.2	Phase optimization	87
3.3.2	Maximization of the operator spectral radius	89
3.3.2.1	The general case	89
3.3.2.2	Particular case. Optimization of the mirror shape in an open resonator	90
4	Analytical Solutions	93
4.1	Analytical solutions of a general class of nonlinear integral equation with free phase	93
4.1.1	Finite-parametric representation of the solutions	94
4.1.2	The main properties of the solutions	96
4.1.3	Branching of the solutions	99
4.1.4	Strategy for numerical investigation	105
4.2	A particular case: one-dimensional Fourier transformation	107
4.2.1	Finite-parametric representation of solutions	108
4.2.2	Branching of the solutions	112
4.2.3	Numerical results	114
4.3	A particular case: discrete Fourier transformation	121

4.3.1	Finite-parametric representation of solutions	122
4.3.2	Branching of the solutions	123
4.3.3	Numerical results	124
4.3.3.1	The case of symmetrical data	124
4.3.3.2	Asymmetrical perturbed data	130
4.4	A particular case: the Hankel transform	132
4.5	Generalized nonlinear integral equation for the compact operator	136
4.5.1	Finite-parametric representation of solutions	137
4.5.2	Branching of solutions	142
4.5.3	Numerical results	146
5	Numerical Methods, Algorithms and Results	151
5.1	Theoretical results	151
5.1.1	Direct minimization of functionals	152
5.1.1.1	The case of an isometric operator	152
5.1.1.2	The case of a compact operator	156
5.1.2	The simplest iteration method	159
5.1.2.1	The case of an isometric operator	159
5.1.2.2	The case of a compact operator	162
5.2	Methods of Newton type	168
5.2.1	General scheme of the method	168
5.2.2	The particular case of a compact operator	170
5.2.3	Phase optimization problems	174
5.2.3.1	Continuous Fourier transform: theoretical results	176
5.2.3.2	Continuous Fourier transform: numerical results	184
5.2.3.3	Discrete Fourier transform	189
5.3	The method of opposite directions	193
5.3.1	Optimization of multi-element phase field transformers	194
5.3.1.1	Problem formulation. Property of solutions	194
5.3.1.2	Description of the algorithm. Numerical results	201
5.3.2	Optimization of multi-element phase beam transformers	207
5.3.2.1	Problem formulation	207
5.3.2.2	Description of the algorithm. Numerical results	209
5.4	The method of generalized separation of variables	210
5.4.1	Description of the method for linear problems	212
5.4.2	Generalization for nonlinear problems. Synthesis of antenna array	214
5.4.3	Numerical results	218
5.5	Homogeneous problems	221
5.5.1	Minimization of losses in waveguide walls	221
5.5.1.1	Problem formulation	221
5.5.1.2	Description of the algorithm	222
5.5.1.3	Numerical results	224
5.5.2	Open resonators with shifted mirrors	226
5.5.2.1	Problem formulation	226
5.5.2.2	Description of the algorithm. Numerical results	228

6	Nonstandard Inverse Problems of Diffraction Theory	233
6.1	Introduction. Outline of the chapter	233
6.1.1	Object of investigation	233
6.1.2	Content of the chapter	234
6.1.3	Other inverse problems	236
6.2	Diffraction on impedance surfaces. 'Invisible' bodies and screens	237
6.2.1	Impedance plane	237
6.2.1.1	Impedance conditions	237
6.2.1.2	Surface waves on the plane	239
6.2.1.3	Corrugated surface (goffer)	240
6.2.2	Diffraction on the impedance circular cylinder and on the impedance sphere	244
6.2.2.1	Surface waves on the cylinder	244
6.2.2.2	The Watson series. Amplitudes of surface waves	250
6.2.2.3	Complex impedance providing radar invisibility of circular cylinder	253
6.2.2.4	Impedance sphere. Mutual cancellation of reflected fields at $w = 1$	259
6.2.3	Impedance providing invisibility of the cylinder with arbitrary cross-section	262
6.2.3.1	Variable impedance	262
6.2.3.2	System of integral equations	262
6.2.3.3	Numerical solution of the integral equation system	266
6.2.3.4	Cylinder of elliptical of cross-section	267
6.2.4	Matched impedance. Invisible screen	270
6.2.5	Waveguides and resonators with impedance walls	275
6.2.5.1	Regular waveguides	275
6.2.5.2	Circular waveguides with an azimuthal goffer	276
6.2.5.3	Impedance transformer of the field structure	280
6.2.5.4	Resonators with impedance walls	281
6.3	Metallic short-periodical array	283
6.3.1	Equivalent boundary conditions	284
6.3.2	Electric polarization	285
6.3.3	Magnetic polarization	287
6.3.4	Short-periodical grid	288
6.4	Creation of a field of circular polarization	290
6.4.1	Transformation of linear polarization into circular	290
6.4.2	Resonant antenna and transmission resonator of circular shape	291
	Epilogue: Ethical Aspects of Scientific Work	293
