## Description of Syntheses

As shown in Scheme S1, the quinoline monomer 8a was prepared by introduction of the BOCprotected aminopropoxy side chain to the quinolone $7^{[1]}$ under Mitsunobu conditions. The corresponding monomer amine $\mathbf{8 b}$ was obtained by hydrogenation of $\mathbf{8 a}$, while the acid $\mathbf{8 c}$ was prepared by saponification of the methyl ester. The Ghosez reagent was used to activate 8c to the corresponding acid chloride, which was then coupled with $\mathbf{8 b}$ to provide the dimer $\mathbf{9 a}$. No signs of BOC deprotection were observed under the activation or coupling conditions. The reaction was very clean and 9a could be isolated by recrystallization, allowing the reaction to be easily performed on a multigram scale. Using the same procedures, $\mathbf{9 a}$ could be converted to the corresponding amine $\mathbf{9 b}$ and acid $\mathbf{9 c}$, which were coupled to form the tetramer 10a. Rather than continuing in a convergent manner, due to difficulties in activation of the tetramer acid, the most efficient method to access the octamer was found to be two subsequent additions of the acid chloride of $\mathbf{9 c}$ to the tetramer, providing first the hexamer 11a, then the octamer 12a.

## Scheme S1

The BOC protecting groups were cleanly removed from the octamer 12a using 1:1 $\mathrm{TFA} / \mathrm{CH}_{2} \mathrm{Cl}_{2}$ to provide 13 as shown in Scheme S 2 . Although 13a was highly soluble in pure water,
limited solubility was observed in phosphate buffers of neutral pH . It was hypothesized that an octamer having an ionizable acid terminus might exhibit improved solubility under biological conditions. Indeed, conversion of the methyl ester of 12a to the acid 12c, followed by deprotection provided octamer 1 which had good solubility (> $1 \mathrm{mg} / \mathrm{mL}$ ) in

Scheme S2 biological buffers.

To test the effect of charge density on the biological properties, the side chain amine groups of octamer 13 were functionalized with lysine groups using the BOC protected lysine pentafluorophenyl ester $\mathbf{1 4}^{2}$ to give $\mathbf{1 5 a}$ as shown in Scheme S3. Deprotection of 15a provided 2, having two cationic amine side chains per quinoline unit. 2 exhibited good solubility in pure water and in buffers.

## Scheme S3

While the synthesis of longer oligomers by sequential addition of dimer acid chlorides may eventually give long oligomers, a more convergent strategy is desirable for efficient growth. It has recently been demonstrated by our group that the introduction of 2,6-diaminomethylpyridine spacers within quinoline oligomers preserves the helical conformation. ${ }^{3}$ In addition, the aliphatic amines of the spacer couple efficiently with the quinoline oligomer acids, thus allowing standard peptide coupling reagents to be used in place of acid chlorides. Indeed reaction of the pyridine spacer $\mathbf{1 6}^{3}$ with octamer acid 12c in the presence of HBTU and HOBt provided the heptadecamer 17, which can be deprotected to provide 3 under standard conditions (Scheme S4). In an analogous manner, as shown in Scheme S5, the lysine functionalized octamer acid 15b also reacted with pyridine $\mathbf{1 6}$ to provide the heptadecamer 18 which was deprotected to give 4 .

## Scheme S5

To introduce PEO to the cationic quinoline-based oligoamides, a commercially available poly(ethylene glycol) monomethyl ether 19 with a MW of $1100 \mathrm{~g} / \mathrm{mol}$ was first oxidized to the acid 20 under Jones conditions (Scheme S6). This acid was activated to the corresponding acid chloride using thionyl chloride, and then was coupled with the octamer amine 12b to provide 21. Standard deprotection conditions provided the oligocation 5.

The reaction of 12a with ethylene diamine in the presence of DMAP and gentle heating provided 22, bearing an aliphatic amine functional handle which was reacted with fluorescein 5isothiocyanate to provide 23. 23 was deprotected to form $\mathbf{6}$ which was purified by HPLC in aqueous conditions (Scheme S7).

## Protease degradation analysis.

The resistance of oligomer 1 to proteolytic enzymes was probed with proteases characterized by either low specificity (protease K, pepsin, subtilisin) or high specificity toward positively charged residues (trypsin). A 24h time-course experiment was monitored by on-line LC-ESI-MS with UV spectrophotometric detection (Figure S1), and off-line MALDI-MS. Control experiments were run simultaneously for each protease:

- incubation of oligomer $\mathbf{1}$ in buffer to check its potential own degradation
- incubation of protease in buffer to check its potential autolysis
- proteolysis of horse heart cytochrome C to check protease activity
- blank with buffer alone.

## Experimental section

General Procedures and Materials. Unless otherwise noted, materials were obtained from commercial suppliers and used without further purification. THF was distilled from Na /benzophenone while $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and diisopropylethylamine (DIEA) were distilled from $\mathrm{CaH}_{2}$ prior to use. Chemical shifts are reported in ppm and are calibrated against residual solvent signals of $\mathrm{CDCl}_{3}(\delta 7.26,77.2), \mathrm{DMSO}_{3}(\delta 2.50,39.4)$, or $\mathrm{CD}_{3} \mathrm{OD}(\delta 3.31,49.1)$. All coupling constants are reported in Hz. Silica gel chromatography was performed using Merck Kieselgel Si 60. Preparative size exclusion chromatography was performed using a Shimadzu LC-20AT pump and SPD-20A Uvvisible detector equipped with a manual recycling valve and Jaigel-1H and Jaigel-2H 20x600 mm columns (Japan Analytical Co.). Electrospray ionization (ESI) and high resolution electrospray ionization time of flight (HR-ESI) mass spectra were obtained in the positive ion mode and matrix assisted laser desorption ionization time of flight (MALDI) mass spectra were obtained in positive ion mode using $\alpha$-cyanohydroxycinnamic acid as a matrix.

Monomer 8a. The quinolone $7^{1}(8.0 \mathrm{~g}, 32 \mathrm{mmol}, 1.0$ equiv. $)$, triphenylphosphine $\left(\mathrm{PPh}_{3}\right)(9.3 \mathrm{~g}, 35$ mmol, 1.1 equiv.) and $N$-(t-butoxycarbonyl)-3-aminopropanol ${ }^{4}$ ( $6.2 \mathrm{~g}, 36 \mathrm{mmol}, 1.1$ equiv.) were combined under argon, then partially dissolved in dry THF ( 100 mL ). The reaction mixture was cooled to $0^{\circ} \mathrm{C}$, then diisopropylazodicarboxylate (DIAD) ( $7.2 \mathrm{~mL}, 36 \mathrm{mmol}, 1.1$ equiv.) was added. The reaction mixture was stirred at $0^{\circ} \mathrm{C}$ for 30 min , then was allowed to come to rt and was stirred overnight. The reaction mixture was evaporated, then the product was recrystallized from 130 mL of $3 / 1 \mathrm{MeOH} / \mathrm{CHCl}_{3}$ to provide 9.1 g ( $77 \%$ yield) of $\mathbf{8 a}$ as a pale brown solid. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400\right.$ $\mathrm{MHz}): \delta 1.41(\mathrm{~s}, 9 \mathrm{H}), 2.15-2.21(\mathrm{~m}, 2 \mathrm{H}), 3.38-3.44(\mathrm{~m}, 2 \mathrm{H}), 4.01(\mathrm{~s}, 3 \mathrm{H}), 4.37(\mathrm{t}, 2 \mathrm{H}, J=6.0), 4.80$ (br s, 1H), 7.61-7.65 (m, 2H), $8.08(\mathrm{~d}, 1 \mathrm{H}, J=7.3), 8.43(\mathrm{~d}, 1 \mathrm{H}, J=8.3) .{ }^{13} \mathrm{C} \operatorname{NMR}\left(\mathrm{CDCl}_{3}, 100\right.$ $\mathrm{MHz}): \delta 28.5,29.5,37.8,53.5,67.4,79.7,102.3,123.3,125.3,126.2,126.5,140.1,148.5,151.4$, 156.1, 162.6, 165.7. General procedure for the nitro group reduction. The nitro precursor (eg. 5 mmol ) was dissolved in 400 mL of EtOAc , and 200 mg of $10 \mathrm{wt} \% \mathrm{Pd} / \mathrm{C}$ was added. The reaction was stirred under a hydrogen atmosphere overnight (pressure provided by a balloon). Progress was monitored by TLC
and NMR, and additional Pd/C was added if necessary to complete the reaction. Upon completion the catalyst was removed by filtration over celite and the filtrate was evaporated to provide the amine. The product was characterized by ${ }^{1} \mathrm{H}$ NMR and used in the next step without further purification.

General procedure for the methyl ester saponification. The methyl ester (eg. 6.4 mmol ) was dissolved in 75 mL of THF and 25 mL of MeOH was added, followed by KOH ( 15.9 mmol ). The reaction mixture was stirred at room temperature overnight, and then was acidified with acetic acid. The mixture was partitioned between $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and water, and then the $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ layer was washed 3 times with water, dried with $\mathrm{MgSO}_{4}$, filtered and evaporated to provide the product. The product was azeotroped with toluene to remove all traces of water and acetic acid, characterized by ${ }^{1} \mathrm{H}$ NMR, and used in the next step without further purification.

General procedure for coupling an amine and an acid. The acid (eg. 1.2 mmol ) was suspended in 40 mL of dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ under an argon atmosphere and 1-chloro- $\mathrm{N}, \mathrm{N}, 2$-trimethylpropenylamine (2.5 mmol) was added. The reaction mixture was stirred at rt for 2 h resulting in a homogeneous solution, then evaporated to provide the corresponding acid chloride. To a solution of the amine ( 1.1 mmol ) in 20 mL of dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ containing DIEA ( 3.7 mmol ), the acid chloride in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was added via cannula. The reaction mixture was stirred at rt overnight, then the solvent was evaporated.

General procedure for the removal of the BOC protecting groups. The BOC protected oligomer (eg. $40 \mu \mathrm{~mol}$ ) was dissolved in 4 mL of $1 / 1 \mathrm{CH}_{2} \mathrm{Cl}_{2}:$ TFA and was stirred at room temperature for 2 h. The solvent was evaporated to provide the TFA salt of the product as a glassy solid.

General procedure for the synthesis of heptadecamers. The octamer acid ( $36 \mu \mathrm{~mol}$ ), HBTU ( 50 $\mu \mathrm{mol})$, and HOBt ( $33 \mu \mathrm{~mol}$ ) were dissolved in 0.8 mL of dry DMF under an argon atmosphere and resulting solution was stirred at room temperature for 30 min . Diamine $\mathbf{1 6}^{3}(14 \mu \mathrm{~mol})$ was added and the reaction mixture was stirred at overnight at room temperature. Additional HBTU ( $50 \mu \mathrm{~mol})$ was added, and the reaction mixture was stirred for an additional 24 h before diluting with toluene and washing three times with $1 \mathrm{M} \mathrm{NaHCO}_{3}$ solution. The organic phase was dried with $\mathrm{MgSO}_{4}$, filtered and evaporated. The product was purified by preparative size exclusion chromatography.

Fluorescein functionalized octamer 6. To a solution of the amine functionalized octamer 22 (40 $\mathrm{mg}, \mu \mathrm{mol}, 1.0$ equiv.) in 0.5 mL of DMF was added fluorescein 5-isothiocyanate ( $6.1 \mathrm{mg}, 16 \mu \mathrm{~mol}$, 1.1 equiv.) and the reaction mixture was stirred at room temperature overnight. The DMF was evaporated in vacuo, then the resulting product was dissolved in $1 / 1 \mathrm{TFA} / \mathrm{CH}_{2} \mathrm{Cl}_{2}$ and stirred at rt for 2 h . The solvents were evaporated to provide the crude product. The product was purified by multiple semipreparative HPLC runs using a C18 column and a water/acetonitrile gradient with $0.1 \%$ TFA to provide approximately 20 mg of $\mathbf{6} .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CD}_{3} \mathrm{OD}, 400 \mathrm{MHz}\right): \delta 2.24-2.70(\mathrm{~m}$, $16 \mathrm{H}), 3.20-3.58(\mathrm{~m}, 20 \mathrm{H}), 4.14-4.70(\mathrm{~m}, 16 \mathrm{H}), 6.24(\mathrm{~s}, 1 \mathrm{H}), 6.39-6.48(\mathrm{~m}, 5 \mathrm{H}), 6.52(\mathrm{~s}, 1 \mathrm{H}), 6.58(\mathrm{~s}$, $1 \mathrm{H}), 6.63(\mathrm{~s}, 1 \mathrm{H}), 6.66(\mathrm{~s}, 2 \mathrm{H}), 6.70(\mathrm{~s}, 1 \mathrm{H}), 6.81(\mathrm{~d}, 1 \mathrm{H}, J=8.1), 7.11(\mathrm{~d}, 1 \mathrm{H}, J=8.1), 7.19(\mathrm{~s}, 1 \mathrm{H})$, 7.24-7.28 (m, 2H), 7.39-7.55 (m, 9H), 7.60-7.68 (m, 2H), 7.76-7.99 (m, 7H), 8.03-8.07 (m, 2H), 8.09-8.13 (m, 1H), $8.23(\mathrm{~d}, 1 \mathrm{H}, J=7.1), 8.31(\mathrm{~d}, 1 \mathrm{H}, J=6.8), 8.46(\mathrm{~d}, 1 \mathrm{H}, J=7.8), 11.22(\mathrm{~s}, 1 \mathrm{H})$, $11.25(\mathrm{~s}, 2 \mathrm{H}), 11.31(\mathrm{~s}, 1 \mathrm{H}), 11.37(\mathrm{~s}, 1 \mathrm{H}), 11.42(\mathrm{~s}, 1 \mathrm{H}), 11.79(\mathrm{~s}, 1 \mathrm{H}) . \mathrm{MS}$ calcd $[\mathrm{M}+\mathrm{H}]^{+}$ $\left(\mathrm{C}_{127} \mathrm{H}_{122} \mathrm{~N}_{27} \mathrm{O}_{23} \mathrm{~S}\right): 2424.8928$. ## Protease degradation assays.

In a typical assay, a solution of protease (all purchased from Sigma) and oligomer 1 solution was prepared with ultra high quality water (Elga purification system, further referred as UHQ water). Stock solutions of trypsin, proteinase $K$ and subtilisin were prepared at $1 \mu \mathrm{~g} / \mu \mathrm{l}$ concentration in a 50 mM ammonium bicarbonate buffer at pH 8.2 . A $1 \mu \mathrm{~g} / \mu 1$ pepsin stock solution was prepared in a 50 mM ammonium acetate solution adjusted at pH 2.5 with glacial acetic acid. An oligomer $\mathbf{1}$ stock solution was adjusted at $2.8 \mu \mathrm{~g} / \mu \mathrm{l}$ in UHQ water. All degradations assays were performed in Eppendorf tubes held at $35^{\circ} \mathrm{C}$ (water bath) using 1 nanomole of oligomer $\mathbf{1}$ (volume adjusted to 100 $\mu \mathrm{l})$ for each assay. For time-course analysis, $10 \mu \mathrm{l}$ aliquots taken after $0.5,3$, and 24 h were analyzed by both MALDI-MS and LC-ESI-MS. Combined LC-MS was performed using a monolithic Styros C4 column ( $50 \times 2 \mathrm{~mm}$ ) directly coupled to the ESI source of a LCQ Advantage ion trap mass spectrometer (Thermo Fisher). Eluents A and B were $0.1 \%$ acetic acid in UHQ water and $0.1 \%$ acetic acid in acetonitrile respectively, with a linear gradient from 0 to $90 \%$ B in 19 min at 200 $\mu 1 /$ min flow rate). A UV5000 diode array spectrophotometer was used for detection at three wavelengths (214, 280 and 325 nm ). MALDI-MS analysis was performed with a Reflex III mass spectrometer (Bruker) operated in the reflectron mode, using alpha-cyano-4-hydroxy-cinnamic acid as a matrix. Control experiments for the four enzymes, including proteolysis of horse heart cytochrome C (1 nmole, Sigma) were analyzed with the same protocol.

Cell Cytotoxicity Assay. HeLa cells were cultured in Dulbecco's Modified Eagle Medium (DMEM), containing $10 \%$ FBS. Cells were seeded onto a 96 -well plate at a density of 5000 cells per well and solutions of the cationic helices at varying concentrations in DMEM were added, providing a final volume of $100 \mu \mathrm{~L}$ per well. Following incubation in the presence of the helices for $24 \mathrm{~h}\left(37{ }^{\circ} \mathrm{C}, 5 \% \mathrm{CO}_{2}\right), 20 \mu \mathrm{~L}$ of Cell Titer $96^{\circledR}{ }^{\circledR} \mathrm{AQ}_{\text {ueous }}$ One Solution (Promega) was added to each well, and the cells were incubated for 1 hr . The absorbance at 490 nm was read on a plate reader. The tests were conducted in triplicate for each concentration. Optical densities measured for wells containing cells that received no helices were considered to represent $100 \%$ growth.

DNA Transfection. The pGL3 plasmid DNA encoding for firefly luciferase (Promega, $1 \mu \mathrm{~g} / \mathrm{well}$ ) was mixed with polycations at varying charge ratios in 150 mM NaCl in polystyrene tubes and
allowed to sit for 30 minutes. Lipofectamine (Invitrogen) was used as a positive control, as recommended by the manufacturer. HeLa cells were plated in a 24 -well plate at a density of $7.5 \times$ $10^{4}$ cells/well, and grown at $37^{\circ} \mathrm{C}$ for 24 h prior to transfection in Dulbecco's Modified Eagle Medium (DMEM), supplemented with $10 \%$ FCS, 2 mM L-glutamine and $1 \%$ non-essential aminoacids (all from Invitrogen), in a $5 \% \mathrm{CO}_{2}$ atmosphere. The medium was carefully aspirated and the cells were rinsed with serum-free medium. Serum-free medium ( $250 \mu \mathrm{~L} /$ well ) was added, followed by $50 \mu \mathrm{~L}$ of the DNA-polycation complex and the cells were incubated at $37^{\circ} \mathrm{C}$ for 2 hours before $300 \mu \mathrm{~L} /$ well of medium containing $20 \%$ FBS was added. After 48 hours the medium was removed; the cells were washed with cold phosphate buffered saline (PBS) and lysed in $100 \mu \mathrm{~L} /$ well of lysis solution provided in the Luciferase Assay System (Promega). The samples were placed on ice for 30 min , homogenized by pipeting and firefly luciferase activity was measured in a luminometer (Berthold, Lumat LB9501) on $20 \mu \mathrm{~L}$ of cell lysate using the Luciferase assay kit. The results, expressed as arbitrary light units normalized for the number of cells (evaluated from the amount cell protein quantified the Bradford reaction) in each well are given below, indicating luciferase activity.

Cell viability test. Cells were grown in the 96 well microplates, 500 cells/well. Cell viability was assessed using the CEllTiter96 Aqueous one Solution Reagent (Promega) and a spectrophotometric microplate reader at 490 nm (Bio-Tek).

Confocal Microscopy. HeLa cells $\left(2.0 \times 10^{4} /\right.$ well $)$ were seeded onto a 16 -well Lab-tek chamber slide (Nalge Nunc International) and grown for 24 h before addition of the fluorescein-labeled cationic helix 6 at varying concentrations. Following incubation of the cells in the presence of the helices for the desired time period, the medium was carefully removed, the wells were rinsed three times with PBS and fixed for 5 min at room temperature in a $4 \%$ formaldehyde solution in PBS. The wells were rinsed with PBS, and the slide was mounted with a coverslip using the S7461 antifading solution (Molecular Probes). Images were obtained using a Leica SP5 confocal microscope and a 100X oil immersion objective.

Cell uptake assay. HeLa cells $\left(8.0 \times 10^{4} /\right.$ well $)$ in DMEM were seeded onto a 24 -well plate and incubated overnight $\left(37^{\circ} \mathrm{C}, 5 \% \mathrm{CO}_{2}\right)$. The following day, $\mathbf{1 8 b}$ and FITC-Tat ${ }_{47-57}$ were added at the concentrations of $0.1 \mu \mathrm{M}, 1.0 \mu \mathrm{M}$ or $10 \mu \mathrm{M}$ in a total volume of $200 \mu \mathrm{~L}$ of DMEM/well. The cells were incubated $\left(37^{\circ} \mathrm{C}, 5 \% \mathrm{CO}_{2}\right)$ for either 10 min or 1 hr , then the medium was carefully removed and the cells were washed 3 times with PBS. The cells were detached from the well by a trypsine/EDTA solution, suspended in 0.5 ml PBS and placed on ice. The cells were analyzed for FITC fluorescence by flow cytometry using a Beckman Coulter Epics XL cytometer. Basal fluorescence was given by Hela cells that were not incubated with fluorescent compounds. Each sample was run in triplicate $2.0 \times 10^{4}$.
