# Enantioselective Chromium-Catalyzed Carbonyl-ene Cyclizations 

Melissa L. Grachan, Matthew T. Tudge, Eric N. Jacobsen*<br>Department of Chemistry and Chemical Biology, Harvard University, 12 Oxford Street, Cambridge, Massachusetts 02138

General protocol. Unless noted otherwise, all reactions were performed in flame dried round bottom flasks fitted with rubber septa, under a nitrogen atmosphere. All air or moisture sensitive liquids were transferred by syringe or stainless steel cannulae. In addition, all air or moisture sensitive solids were handled in a nitrogen-filled glovebox. Flash chromatography was conducted using 60 silica (mesh 230-400) from EM Science.

Reagents. All reagents were purchased from Lancaster, Sigma-Aldrich, Alfa-Aesar, or Fluka Chemicals and were used as received unless otherwise stated. Anhydrous THF and ether were obtained via distillation from sodium benzophenone at 760 Torr. Anhydrous dichloromethane was obtained via distillation from $\mathrm{CaH}_{2}$ at 760 Torr and toluene was distilled from sodium metal at 760 Torr.

Instrumentation. Proton and carbon nuclear magnetic resonance ( ${ }^{1} \mathrm{H} \&{ }^{13} \mathrm{C}$ NMR) spectra were recorded on Varian-Mercury $400(400 \mathrm{MHz})$, Inova-500 (500 MHz) or Inova-600 (600 MHz ) spectrometers. Chemical shifts for protons are reported in parts per million ( ppm ) downfield from tetramethylsilane and are referenced against the chloroform lock signal ( ${ }^{1} \mathrm{H}$, $7.26 ;{ }^{13} \mathrm{C}, 77.0 \mathrm{ppm}$ ). Data is reported as follows: chemical shift, integration, multiplicity ( $\mathrm{s}=$ singlet, $\mathrm{d}=$ doublet, $\mathrm{t}=$ triplet, $\mathrm{q}=$ quartet, $\mathrm{dd}=$ doublet of doublets, $\mathrm{m}=$ multiplet) coupling constants (Hz) and proton assignment. Infrared spectra (IR) were recorded on a Mattson-Galaxy Series FTIR 3000 spectrophotometer referenced to a polystyrene standard. Absorbancies are reported in wave numbers $\left(\mathrm{cm}^{-1}\right)$ and their relative intensities assigned as strong ( s ), medium (m), or weak (w). Optical rotations were measured using a 2 mL cell on a Jasco DIP 370 digital polarimeter. Mass spectra were obtained from the Harvard University mass spectrometry service. Chiral HPLC analysis was performed on a Shimadzu VP-series instrument; chiral GC analysis was performed on a Hewlett-Packard 5890 gas chromatograph using a Chiraldex $\gamma$-TA ( $30 \mathrm{~m} \times 0.25 \mathrm{~mm}$ ) column or an Alltech Cyclodex $\beta$ ( 30 mx 0.25 mm ) column.

## 1) Preparation of catalyst 1c

Ligand S-1 was prepared in accordance with the published procedure. ${ }^{1}$

## (1R, 2S)-Cr(III) catalyst 1c

S-1

To a stirred solution of ligand $\mathbf{S - 1}(1.0 \mathrm{~g}, 2.58 \mathrm{mmol})$ in THF $(30 \mathrm{~mL})$ was added anhydrous chromium-(II)-chloride under a gentle flow of nitrogen. The mixture was stirred for $1 \mathrm{~h}, 2,6$ lutidine ( $1.62 \mathrm{~mL}, 13.9 \mathrm{mmol}$ ) was added, and stirring was continued for an additional 1.5 h . The reaction mixture was then diluted with TBME ( 60 mL ) and washed sequentially with 0.5 N $\mathrm{HCl}(2 \times 100 \mathrm{~mL})$ and brine ( 200 mL ). The organic phase was then separated, dried over anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated to give a brown solid. Finally, the solid was dried azeotropically three times with anhydrous benzene to afford the desired catalyst 1c ( 980 mg , $77 \%$ ) which was used without further purification. Characterization of 1c by X-ray crystallography and CD spectroscopy has been described previously. ${ }^{1,2}$

## 2) Substrate Preparation

## General procedure A: Preparation of tertiary alcohols

## THP = 2-tetrahydropyranyl

To a cold ( $-78^{\circ} \mathrm{C}$ ), stirred solution of methyl 2-(tetrahydro-2H-pyran-2-yloxy) acetate ( $7.0 \mathrm{~g}, 6.1$ $\mathrm{mL}, 40.2 \mathrm{mmol}$ ) in ether ( 100 mL ) was added the required alkyl magnesium halide ( 121 mmol ) dropwise over 20 minutes. The reaction mixture was allowed to warm to room temperature and stirring continued for $1-24 \mathrm{~h}$. After complete consumption of the starting ester, the reaction mixture was carefully poured onto cold $\left(0^{\circ} \mathrm{C}\right)$ saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 200 mL ). Additional $\mathrm{Et}_{2} \mathrm{O}(100 \mathrm{~mL})$ was added and the organic phase separated. The aqueous phase was extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 100 \mathrm{~mL})$ and the combined organic extracts washed with brine (200 mL ). The organic phase was separated, dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$, and concentrated in vacuo to afford the crude product. Purification by column chromatography eluting with $10-20 \%$ ether / hexanes afforded the desired products.

## General procedure B: Alkylation of tertiary alcohols

[^0]

To a cooled ( $10{ }^{\circ} \mathrm{C}$ ), stirred solution of the tertiary alcohol (35.9 mmol) in $N, N-$ dimethylformamide ( 50 mL ) was added tetrabutylammonium iodide ( $2.6 \mathrm{~g}, 7.2 \mathrm{mmol}$ ). The solution was then cautiously treated with sodium hydride ( $951 \mathrm{mg}, 39.5 \mathrm{mmol}$ ) and allowed to warm to room temperature over 30 min during which time the solution had turned yellow. The reaction mixture was then treated with the alkyl halide ( 43.8 mmol ) and stirred until no starting material remained by TLC. The solution was then cooled to $0^{\circ} \mathrm{C}$, carefully quenched by the addition of water (ca. $0.5 \mathrm{ml} / \mathrm{mmol}$ of NaH ) and diluted with ether ( 60 mL ). The ethereal solution was washed with water $(2 \times 300 \mathrm{~mL})$ and then brine $(300 \mathrm{~mL})$ before being separated and dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$. Finally the solvent was removed in vacuo to afford the crude product. Purification by flash chromatography ( $3-5 \% \mathrm{Et}_{2} \mathrm{O} /$ hexanes) afforded the desired products as colorless oils.

## General procedure C: Deprotection of THP ethers

The THP ether ( 25.6 mmol ) was dissolved in $4: 1: 2 \mathrm{AcOH} / \mathrm{H}_{2} \mathrm{O} / \mathrm{THF}(100 \mathrm{~mL})$ and stirred at room temperature until no starting material remained by TLC (ca. $24-48 \mathrm{~h}$ ). The reaction mixture was poured onto cold $\left(4^{\circ} \mathrm{C}\right) \mathrm{NaOH}$ before being extracted with ether $(3 \times 30 \mathrm{~mL})$. The combined organic extracts were washed with brine ( 100 mL ), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$, and concentrated in vacuo to afford the crude product. Purification by flash chromatography, eluting with $8-15 \%$ $\mathrm{Et}_{2} \mathrm{O} /$ hexanes, provided the desired primary alcohols as colorless oils.

General procedure D: Preparation of aldehydes with Dess-Martin periodinane

To a cold $\left(0^{\circ} \mathrm{C}\right)$ stirred solution of the alcohol $(2.0 \mathrm{~g}, 12.7 \mathrm{mmol})$ in reagent grade $\mathrm{CH}_{2} \mathrm{Cl}_{2}(50$ $\mathrm{mL})$ was added pyridine ( $1.0 \mathrm{~mL}, 67.8 \mathrm{mmol}$ ) followed by Dess-Martin periodinane $(6.4 \mathrm{~g}, 15.2$ mmol ). The reaction was stirred until no starting material remained by TLC (ca. $2-4 \mathrm{~h}$ ) at which point hexanes ( 50 mL ) was added. The organic solution was then poured onto a $1: 1$ mixture of saturated aqueous $\mathrm{NaHCO}_{3}(75 \mathrm{~mL})$ and $10 \% \mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{3}$. The biphasic solution was stirred for 15 minutes, separated, and the aqueous extracted with $1: 1 \mathrm{Et}_{2} \mathrm{O} /$ hexanes ( $2 \times 50 \mathrm{~mL}$ ). The combined organic extracts were washed with brine ( 100 mL ), dried $\left(\mathrm{Na}_{2} \mathrm{SO}_{4}\right)$ and concentrated in vacuo to give the crude product. Purification by flash column chromatography, eluting with $5-10 \% \mathrm{Et}_{2} \mathrm{O} /$ hexanes, afforded the desired aldehydes which, unless otherwise noted, could be stored for several months at $-78^{\circ} \mathrm{C}$ without deterioration.

The reaction vessel was transferred to a $0{ }^{\circ} \mathrm{C}$ bath for 15 minutes. The solution was cooled to $-78{ }^{\circ} \mathrm{C}$ and methyl dimethoxyacetate ( $4.55 \mathrm{~mL}, 37.0 \mathrm{mmol}$ ) was added to it dropwise. After stirring for 10 minutes at $-78^{\circ} \mathrm{C}$, the reaction mixture was transferred to a $0^{\circ} \mathrm{C}$ bath for 30 minutes. The solution was then cooled to $-78^{\circ} \mathrm{C}$ and 4 -iodo-2-methylbut-1-ene ${ }^{4}$ ( $3.63 \mathrm{~mL}, 18.5 \mathrm{mmol}$ ) was added dropwise. The $-78^{\circ} \mathrm{C}$ bath was allowed to warm to $4^{\circ} \mathrm{C}$ and the reaction mixture was stirred for an additional 12 hours. The reaction mixture was partitioned between $0.25 \mathrm{M} \mathrm{HCl}_{(\text {aq })}(200 \mathrm{~mL})$ and 1:1 diethyl ether / hexanes $(200 \mathrm{~mL})$. Under a gentle flow of nitrogen, ester S-14 ( $1.60 \mathrm{~g}, 7.92 \mathrm{mmol}$ ) was dissolved in anhydrous dichloromethane ( 16 mL ) and cooled to $-78{ }^{\circ} \mathrm{C}$ while stirring. The reaction progress was monitored via GC and after 1 h methanol ( 5 mL ) was added carefully to avoid exotherm. An aqueous solution of $10 \%$ Rochelle's salt ( 10 mL ) was immediately added in one portion and the reaction mixture diluted with diethyl ether ( 10 mL ), removed from the cold bath, and allowed to warm to room temperature while stirring vigorously. 2,10-dimethyl-6-[(tetrahydro-2H-pyran-2-yloxy)methyl]-undeca-2,9-dien-6-ol (S-18)

After the initial exotherm subsided, the reaction mixture was diluted with ether ( 2 mL ) and heated at reflux for 2 h . The solution was then cooled to $-78{ }^{\circ} \mathrm{C}$ and treated with methyl 2-(tetrahydro-2H-pyran-2-yloxy)acetate ( $304 \mu \mathrm{~L}, 2 \mathrm{mmol}$ ) before warming to room temperature over 3 h . The reaction mixture was quenched with saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 20 mL ), diluted with $\mathrm{Et}_{2} \mathrm{O}(10 \mathrm{~mL})$, and the organic phase separated. The aqueous phase was extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 10 \mathrm{~mL})$ and the combined organic extracts were washed with brine ( 20 mL ). Under a gentle flow of nitrogen, malonate S-21 ( $1.00 \mathrm{~g}, 3.09 \mathrm{mmol}$ ) was dissolved in anhydrous dichloromethane ( 5 mL ) and cooled to $-78{ }^{\circ} \mathrm{C}$ while stirring. To a stirred suspension of magnesium ( $8.51 \mathrm{~g}, 350 \mathrm{mmol}$ ) in diethyl ether ( 10 mL ) was added 4-bromo-2-methylbut-1-ene ${ }^{7}(0.51 \mathrm{~mL}, 3.90 \mathrm{mmol})$ dropwise. After the initial exotherm subsided, the reaction mixture was heated at reflux for 2 h . The reaction was then cooled to $-78{ }^{\circ} \mathrm{C}$ and treated with methyl 2-(tetrahydro-2H-pyran-2-yloxy) acetate ( 2.0 g , 11.5 mmol ) before warming to room temperature over 3 h . The reaction mixture was quenched with saturated aqueous $\mathrm{NH}_{4} \mathrm{Cl}$ solution ( 200 mL ), diluted with $\mathrm{Et}_{2} \mathrm{O}(150 \mathrm{~mL})$, and the organic phase separated. The aqueous phase was extracted with $\mathrm{Et}_{2} \mathrm{O}(2 \times 100 \mathrm{~mL})$ and the combined organic extracts then washed with brine ( 200 mL ).
