# Dimeric (salen)Al Complexes Display Expanded Scope in the Conjugate Cyanation of $\alpha, \beta$-Unsaturated Imides 

Clément Mazet, Eric N. Jacobsen*<br>Department of Chemistry and Chemical Biology, Harvard University, 12 Oxford Street, Cambridge, Massachusetts 02138, USA.

#### Abstract

General: All reactions were carried out under an inert atmosphere of $\mathrm{N}_{2}$. Unless otherwise noted, all reagents were purchased from Aldrich or Strem and used without further purification. Solvents were purified and dried using standard methods: toluene and benzene were distilled from sodium; THF was distilled from sodium/benzophenone ketyl; isopropanol was distilled from magnesium onto activated $3 \AA$ molecular sieves. Trimethylsilylcyanide was distilled prior to use. CAUTION!!! Trimethylsilyl cyanide (TMSCN) is a severe poison and should only be used in a hood with good ventilation. When concentrating solutions with either TMSCN or HCN, a potassium carbonate trap was used to remove any residual cyanide. Liquid reagents were transferred with stainless steel syringes or canula. Flash chromatography was performed using silica gel 60 (230400 mesh) from EM Science.

Instrumentation: All ${ }^{1} \mathrm{H}$ NMR and ${ }^{13} \mathrm{C}$ NMR spectra were recorded either on Inova 600 or on Varian Mercury-400 spectrometers at ambient temperature. IR spectra were recorded on a Matteson FTIR 3000. Optical rotations were measured using a 2-mL cell with a 1 dm path length on a Jasco DIP 370 digital polarimeter. The mass spectroscopic data were obtained at the Harvard University mass spectrometry facility. Chiral GC analysis was performed on a Hewlett-Packard 5890 gas chromatograph. Chiral HPLC analysis was performed on a Hewlett-Packard 1050 HPLC.

Experimental: Catalyst 1 was prepared as described previously. ${ }^{i}$ Aluminium complexes 2a-g were prepared following a similar procedure starting from the corresponding bissalen ligands, the synthesis of which has been already described ${ }^{\mathrm{ji}}$ (Note: the ${ }^{1} \mathrm{H}$ NMR spectrum of the dimeric (salen)Al complexes were usually similar to those of the corresponding ligands but substantially broaden with no reliable integration due to the $5 / 2$ spin value of aluminium). All $\alpha, \beta$-unsaturated imides were prepared by Horner-Wadsworth-Emmons olefinations according to literature procedures. ${ }^{\text {ii }, ~ i v, ~}{ }^{\text {v }}$ Data for previously unreported imides $\mathbf{4 f}, \mathbf{4 j}-\mathbf{n}$ and $\mathbf{6 b} \mathbf{- c}$ as well as the cyanation products $\mathbf{5 f}, \mathbf{5 j} \mathbf{- n}$, 7a-c are described below.

2a: IR (neat) 3363.4, 2959.4, 1633.2, $1561.6 \mathrm{~cm}^{-1}$; ESI/MS for $\mathrm{C}_{69} \mathrm{H}_{92} \mathrm{Al}_{2} \mathrm{Cl}_{2} \mathrm{~N}_{4} \mathrm{O}_{8}[\mathrm{M}-$ $\left.2 \mathrm{Cl}+\mathrm{HCO}_{2}{ }^{-}\right]^{+}: 1204.2$ (100\%).

2b: IR (neat) 3433.2, 2955.5, 1633.2, $1559.6 \mathrm{~cm}^{-1}$; ESI/MS for $\mathrm{C}_{70} \mathrm{H}_{94} \mathrm{Al}_{2} \mathrm{Cl}_{2} \mathrm{~N}_{4} \mathrm{O}_{8}$ [M $\left.2 \mathrm{Cl}+\mathrm{HCO}_{2}^{-}\right]^{+}: 1218.2$ (100\%).

2c: IR (neat) 3357.4, 2953.1, 1633.4, $1559.6 \mathrm{~cm}^{-1}$; ESI/MS for $\mathrm{C}_{71} \mathrm{H}_{96} \mathrm{Al}_{2} \mathrm{Cl}_{2} \mathrm{~N}_{4} \mathrm{O}_{8}$ [M $\left.\left.2 \mathrm{Cl}+\mathrm{HCO}_{2}\right]^{-}\right]^{+} 1232.2$ (100\%).

2d: IR (neat) 3450, 2932.3, 1641.9, $1558.5 \mathrm{~cm}^{-1}$; ESI/MS for $\mathrm{C}_{72} \mathrm{H}_{98} \mathrm{Al}_{2} \mathrm{Cl}_{2} \mathrm{~N}_{4} \mathrm{O}_{8}[\mathrm{M}-$ $\left.2 \mathrm{Cl}+\mathrm{CH}_{3} \mathrm{CN}+\mathrm{HCO}_{2} \mathrm{H}+\mathrm{HCO}_{2}^{-}\right]^{+}: 1333.4$ (100\%).

2e: IR (neat) 3503, 2957, 1746.2, 1634.4, $15570 \mathrm{~cm}^{-1}$; ESI/MS for $\mathrm{C}_{73} \mathrm{H}_{100} \mathrm{Al}_{2} \mathrm{Cl}_{2} \mathrm{~N}_{4} \mathrm{O}_{8}$ $\left[\mathrm{M}-2 \mathrm{Cl}+\mathrm{HCO}_{2}^{-}\right]^{+}: 1260.3$ (100\%).

2f: IR (neat) $3430.1,2951.4,2866.6,1633.5,1559.5,1357.6 \mathrm{~cm}^{-1}$; ESI/MS for $\mathrm{C}_{74} \mathrm{H}_{102} \mathrm{Al}_{2} \mathrm{Cl}_{2} \mathrm{~N}_{4} \mathrm{O}_{8}\left[\mathrm{M}-2 \mathrm{Cl}+\mathrm{HCO}_{2}^{-}\right]^{+}: 1274.4$ (100\%).

2g: IR (neat) 3455, 2954, 1633, 1559, $1201 \mathrm{~cm}^{-1}$; ESI/MS for $\mathrm{C}_{76} \mathrm{H}_{106} \mathrm{Al}_{2} \mathrm{Cl}_{2} \mathrm{~N}_{4} \mathrm{O}_{8}$ [M $\left.2 \mathrm{Cl}+\mathrm{HCO}_{2}\right]^{+}: 1302.5$ (100\%).

## Synthesis of L-3:

1,3-phenylenediacetic acid ( 1.00 mmol ) was added to a solution of 2-tert-butyl-6-((E)-((1R,2R)-2-((E)-3,5-di-tert-butyl-2-hydroxybenzylideneamino)cyclohexylimino)methyl) benzene-1,4-diol ( 2.00 mmol ), ${ }^{2}$, vi 1,3 -diisopropylcarbodiimide ( 2.05 mmol ) and 4 -(dimethylamino)-pyridine ( 0.20 mmol ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}(10 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$. The reaction was stirred for 8 hours at ambient temperature, diluted with an additional 50 mL of $\mathrm{CH}_{2} \mathrm{Cl}$, washed with $1 \mathrm{~N} \mathrm{HCl}_{\text {aq }}$, saturated potassium bicarbonate and brine. The solution was concentrated under vaccum and purified by flash chromatography (1:9 ethyl acetate/hexanes) to afford $\mathbf{L}-3$ as a yellow foam in $74 \%$ yield.

L-3: $\mathrm{R}_{f}=0.27$ (1:9 ethyl acetate/hexanes); ${ }^{1} \mathrm{H}$ NMR ( $400 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ) d 8.30 (s, 2H), 8.18 (s, 2H), 7.35-7.30 (m, 6H), 6.98 (d, J $2.4 \mathrm{~Hz}, 2 \mathrm{H}$ ), 6.92 (d, J $2.4 \mathrm{~Hz}, 2 \mathrm{H}$ ), 6.74 (d, J $2.4 \mathrm{~Hz}, 2 \mathrm{H}$ ), $3.81(\mathrm{~s}, 4 \mathrm{H}), 3.31(\mathrm{bm}, 4 \mathrm{H}), 1.93-1.28(\mathrm{bm}, 16 \mathrm{H}), 1.41(\mathrm{~s}, 18 \mathrm{H}), 1.37(\mathrm{~s}$, $18 \mathrm{H}), 1.24$ (s, 18H); ${ }^{13} \mathrm{C}\left(100 \mathrm{MHz}, \mathrm{CDCl}_{3}\right) d 170.5,166.1,164.8,158.4,158.2,141.8$, 140.2, 138.8, 136.6, 134.2, 130.6.129.3, 128.5, 127.1, 126.2, 122.9, 121.5, 118.4, 117.9, $72.7,72.4,41.4,35.2,35.1,34.3,33.3,31.6,31.5,29.7,29.5,29.3,24.5,17.9$; IR (neat) 2957.2, 2836.8, 1758.7, 1629.6, 1439.0, $1119.2 \mathrm{~cm}^{-1}$; ESI/MS for $\mathrm{C}_{74} \mathrm{H}_{98} \mathrm{~N}_{4} \mathrm{O}_{8}[\mathrm{M}+\mathrm{H}]^{+}$: 1172.8 (9\%).

3: IR (neat) 3450, 2954, 1742, 1652, $1257 \mathrm{~cm}^{-1}$; ESI/MS for $\mathrm{C}_{74} \mathrm{H}_{94} \mathrm{Al}_{2} \mathrm{Cl}_{2} \mathrm{~N}_{4} \mathrm{O}_{8}[\mathrm{M}-2 \mathrm{Cl}$ $\left.+\mathrm{HCO}_{2}^{-}\right]^{+}: 1266.1$ (100\%).

## Previously unreported $\alpha, \beta$-unsaturated imides.

## Representative procedure for the conjugate cyanation of $\alpha, \beta$-unsaturated imides.

Aluminium complex $2 \mathbf{e}$ ( $16 \mathrm{mg}, 0.0125 \mathrm{mmol}, 2.5 \mathrm{~mol} \%$ in catalyst, $5 \mathrm{~mol} \%$ in [Al]), imide $4 \mathbf{e}(115 \mathrm{mg}, 0.5 \mathrm{mmol})$ and 1,3-di-tert-butyl-2-methoxy-5-methylbenzene as internal standard $(10 \mu \mathrm{~L})$ were combined in a 4 mL vial equipped with a sure sealed rubber cap. The system was purged by three successive vaccum $/ \mathrm{N}_{2}$ sequences and finally placed under a $\mathrm{N}_{2}$ atmosphere. MTBE $(100 \mu \mathrm{~L})$ and TMSCN $(500 \mu \mathrm{~L}, 3.25 \mathrm{mmol})$ were successively added and the vial was directly placed into an oil bath preheated at $50^{\circ} \mathrm{C}$. After 15 minutes, $i-\mathrm{PrOH}(250 \mu \mathrm{~L}, 3.25 \mathrm{mmol}$ ) was added slowly. The reaction mixture was stirred at $50^{\circ} \mathrm{C}$ for the specified amount of time (see Full Text for details). Volatiles were removed in vaccuo with a $\mathrm{K}_{2} \mathrm{CO}_{3}$ trap. The residue was dissolved in ethyl acetate/hexanes (1:3), filtered through a short plug of silica or Celite ${ }^{\circledR}$ (pasteur pipette) to remove the catalyst and conversion was assessed by ${ }^{1} \mathrm{H}$ NMR spectroscopy. Purification was achieved by flash chromatography (typically, 1:3 ethyl acetate/hexanes, unless otherwise noted) to afford the cyanation product as either white powders or oils.

Comparative study on the reactivity of (salen)Al complexes $1,2 c-g$ and 3 for the catalytic conjugate cyanation of imide 4 e .

see also Figure 2 in the article.

## Effect of temperature on the activity and the enantioselectivity of the catalyst.

Reactions were carried out using catalyst $\mathbf{2 e}$ and imide $\mathbf{4 e}$, following the standard procedure described above. After 1 h the reaction mixture was diluted with 1 mL of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and then worked-up as previously described. At temperatures below $35^{\circ} \mathrm{C}$, reproducibility of the reaction becomes a problem, especially with the monomeric (salen) AlCl complex $\mathbf{1}$. Between 35 to $50^{\circ} \mathrm{C}$, there is a net increase in activity without substantial loss of enantioselectivity. Above $50^{\circ} \mathrm{C}$, both rate and selectivity are decreased. Therefore, all reactions were run at $50^{\circ} \mathrm{C}$ using a $J-K E M$ Scientific thermo-control system.

## Effect of concentration on the catalyst performance.

## Initial rate kinetic experiments.

Reactions were carried out as described in the typical procedure on a 0.5 mmol scale using model substrate $\mathbf{4 e}$, catalyst $(R, R)$ - $\mathbf{2 e}$ at concentration ranging from 2.5 to 17.5 $\mathrm{mol} \%$ (in [Al]) and 1,3-di-tert-butyl-2-methoxy-5-methylbenzene as internal standard $(10 \mu \mathrm{~L})$. To calibrate the ratio 'substrate / internal standard' by ${ }^{1} \mathrm{H}$ NMR spectroscopy, a first aliquot ( $15 \mu \mathrm{~L}$ ) was taken before the addition of $i-\mathrm{PrOH}(t=0 \mathrm{~min})$ and quenched in 1 mL of $\mathrm{CDCl}_{3}$. After addition of i-PrOH, reaction progress was monitored by ${ }^{1} \mathrm{H}$ NMR spectroscopy on the first $20 \%$ of the reaction by taking aliquots ( $15 \mu \mathrm{~L}$ ) quenched by dilution in 1 mL of $\mathrm{CDCl}_{3}$. Integration of the consumption of starting material relative to the internal standard or of the formation of product relative to the internal standard gave similar results.

| initial rate $\mathbf{( M / \mathbf { s } ) \times \mathbf { 1 0 } ^ { - 4 }}$ | [catalyst] $\mathbf{( M \times 1 0 ^ { - 6 }} \mathbf{)}$ |
| :---: | :---: |
