## Substituted Benzhydrols

General Procedure A ( $\boldsymbol{G P} \boldsymbol{A}$ ). In a dried, nitrogen-flushed three-necked round-bottom flask, equipped with a reflux condenser, and two dropping funnels, Mg , which was activated with iodine at $75^{\circ} \mathrm{C}$, was suspended in THF (distilled from Na ). A solution of the bromobenzene derivative in THF was carefully added to the Mg , to keep the solution under reflux. After the reaction was complete, a solution of the benzaldehyde derivative in THF was added. After stirring at room temperature for 2 h , the solution was poured on $0.5 \mathrm{M} \mathrm{NH}_{4} \mathrm{Cl}$-solution $(150 \mathrm{~mL})$ and extracted with $\mathrm{Et}_{2} \mathrm{O}(3 \times 100 \mathrm{~mL})$. The combined organic phases were washed with water ( 100 mL ), dried with $\mathrm{MgSO}_{4}$, and filtered. Evaporation of the solvent in the vacuum gave the crude product. In some cases the benzhydrols were contaminated by the corresponding benzophenones. To remove the by-product, the product mixture was treated with sodium borohydride in ethanol for 12 h at ambient temperature. The solution was then hydrolized with a 0.02 M HCl and extracted with $\mathrm{CH}_{2} \mathrm{Cl}_{2}(5 \times 50 \mathrm{~mL})$. Again the solution was dried and filtered. The evaporation of the solvent in vacuo gave the crude benzhydrol.

3-Chlorobenzhydrol ${ }^{[1]]}(G P A)$ was obtained from $\mathrm{Mg}(3.74 \mathrm{~g}, 154 \mathrm{mmol})$, bromobenzene ( 22.9 g , $146 \mathrm{mmol})$, and 3 -chloro-benzaldehyde ( $20.5 \mathrm{~g}, 146 \mathrm{mmol}$ ). The reduction was carried out with $\mathrm{NaBH}_{4}(2.27 \mathrm{~g}, 60.0 \mathrm{mmol})$ in EtOH ( 200 mL ). The crude product was distilled in the vaccum (118$\left.120^{\circ} \mathrm{C} / 3.6 \times 10^{-5} \mathrm{mbar}\right)$ to give a colorless oil ( $27.5 \mathrm{~g}, 86 \%$ ) which solidified after several hours; mp $37-39^{\circ} \mathrm{C} .{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=2.23$ (br. s, $1 \mathrm{H}, \mathrm{OH}$ ), $5.71(\mathrm{~s}, 1 \mathrm{H}, \mathrm{CHOH}), 7.15-7.32(\mathrm{~m}$, $9 \mathrm{H}, \mathrm{Ar}) ;{ }^{13} \mathrm{C}$ NMR ( $75.5 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=75.7(\mathrm{~d}, \mathrm{CHOH}), 124.6$ (d), 126.6 (d), 127.6 (d), 127.9 (d), 128.7 (d), 129.7 (d), 134.4 (s), 143.2 (s), 145.7 (s); NMR data are in accord with the data previously published. ${ }^{[22]}$

The crude product was distilled in the vaccum (200-204 $\left.{ }^{\circ} \mathrm{C} / 1.0 \times 10^{-2} \mathrm{mbar}\right)$ to give a colorless oil ( $17.8 \mathrm{~g}, 70 \%$ ). ${ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=2.96$ (br. s, $1 \mathrm{H}, \mathrm{OH}$ ), $5.61(\mathrm{~s}, 1 \mathrm{H}, \mathrm{CHOH}), 7.10-7.26(\mathrm{~m}, 8 \mathrm{H}, \mathrm{Ar}) ;{ }^{13} \mathrm{C}$ NMR ( $75.5 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=74.8$ (d, CHOH ), 124.5 (d), 126.4 (d), 127.8 (d), 128.7 (d), 129.8 (d), 133.5 ( s ), 134.4 ( s$), 141.4$ ( s ), 145.2 ( s ).

3,3'-Dichlorobenzhydrol ${ }^{[53]}(G P A)$ was obtained from $\mathrm{Mg}(1.34 \mathrm{~g}, 55.1 \mathrm{mmol})$, 1-bromo-3-chlorobenzene ( $9.57 \mathrm{~g}, 50.0 \mathrm{mmol}$ ), and 3-chloro-benzaldehyde ( $7.03 \mathrm{~g}, 50.0 \mathrm{mmol}$ ). The reduction was carried out with $\mathrm{NaBH}_{4}(0.76 \mathrm{~g}, 20.1 \mathrm{mmol})$ in $\mathrm{EtOH}(80 \mathrm{~mL})$. The crude product was distilled in the vaccum (147-149 ${ }^{\circ} \mathrm{C} / 2.3 \times 10^{-5} \mathrm{mbar}$ ) to give a colorless oil ( $10.1 \mathrm{~g}, 80 \%$ ). ${ }^{1} \mathrm{H}$ NMR ( 300 MHz , $\mathrm{CDCl}_{3}$ ): $\delta=2.41$ (br. s, $1 \mathrm{H}, \mathrm{OH}$ ), 5.73 (s, $1 \mathrm{H}, \mathrm{CHOH}$ ), $7.18-7.36(\mathrm{~m}, 8 \mathrm{H}, \mathrm{Ar}),{ }^{13} \mathrm{C}$ NMR ( 75.5 MHz , $\left.\mathrm{CDCl}_{3}\right): \delta=75.0(\mathrm{~d}, \mathrm{CHOH}), 124.6$ (d), 126.6 (d), 127.7 (d), 129.9 (d), 134.5 (s), 145.1 (s).
3,3',5'-Trichlorobenzhyrol ( $G P A$ ) was obtained from Mg ( $2.67 \mathrm{~g}, 110 \mathrm{mmol}$ ), 1-bromo-3,5dichlorobenzene ( $23.1 \mathrm{~g}, 102 \mathrm{mmol}$ ), and 3 -chloro-benzaldehyde ( $14.1 \mathrm{~g}, 100 \mathrm{mmol}$ ). The crude

## Substituted Benzhydryl Chlorides

General Procedure B ( $\boldsymbol{G P} \boldsymbol{B}$ ). ${ }^{[54,55,56]}$ The benzhydrol derivative was dissolved in either $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ or benzene/petroleum in presence of anhydrous $\mathrm{CaCl}_{2}$ and treated with a stream of dry hydrogen chloride gas. The conversion was monitored by either GC or TLC. After completion, the solvent and HCl were distilled off in the vacuum. Benzhydryl chloride was purified by distillation (b.p. $145-146{ }^{\circ} \mathrm{C} / 3$ 5 mm ). Solvolytic kinetic measurements of the samples before and after distillation in several solvents gave identical rate constants within the experimental error. Other liquid chlorides were used for the kinetic measurement without further purification ${ }^{[54]}$ since the NMR spectra proved the absence of detectable impurities. The crude chlorides were either washed with small amounts of petroleum or crystallized from light petroleum/hexane.

General Procedure C ( $\boldsymbol{G P C} \boldsymbol{C}$ ). The substituted benzhydrol was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $0{ }^{\circ} \mathrm{C}$. Over a dropping funnel, a solution of $\mathrm{SOCl}_{2}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was added to the well stirred solution. After 2 h , the solvent was evaporated in the vacuum and removing of the remaining $\mathrm{SOCl}_{2}\left(60{ }^{\circ} \mathrm{C} / 0.01 \mathrm{mbar}\right)$ furnished the crude product.

## Synthesis of Substituted Benzhydryl Bromides

General Procedure D (GP D). A solution of the benzhydrol derivative in dry $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ was treated by a stream of dry hydrogen bromide gas in a presence of anhydrous $\mathrm{Na}_{2} \mathrm{SO}_{4}$. The conversion was monitored by either GC or TLC. After completion of the conversion, the solvent and the excess of the hydrogen bromide were removed under vacuum. Crude benzhydryl bromides were crystallized from either light petroleum or hexane. The liquid benzhydryl bromides were used without further purification since the NMR spectra proved the absence of detectable impurities.

General Procedure E ( $\boldsymbol{G P} \boldsymbol{E}$ ). The substituted benzhydrol was dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $0{ }^{\circ} \mathrm{C}$. Over a dropping funnel a solution of $\mathrm{PBr}_{3}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, was added to the well stirred solution. The solvent was evaporated in the vacuum, and removing of the remaining $\operatorname{PBr}_{3}\left(60^{\circ} \mathrm{C} / 0.01 \mathrm{mbar}\right)$ gave the crude product.

## Substituted Benzhydryl Trifluoroacetates

Trifluoroacetates were prepared according to the procedure by Bunton and Hadwick ${ }^{[510]}$ with some adjustments.

Benzhydryl trifluoroacetate. A dry diethyl ether solution ( 30 mL ) of benzhydrol ( $2.00 \mathrm{~g}, 10.9 \mathrm{mmol}$ ) and trifluoroacetic anhydride ( $3.30 \mathrm{~g}, 15.7 \mathrm{mmol}$ ) was stirred under Ar atmosphere and cooling with an ice bath for 24 h . Then the reaction mixture was left at ambient temperature for 2 h . The solution was vigorously washed with aqueous $\mathrm{NaHCO}_{3}$. After drying and evaporating the solvent under vacuum, $2.30 \mathrm{~g}(5.85 \mathrm{mmol}, 54 \%)$ of a pale yellow oil remained. According to the NMR spectra the product did not contain the free acid, the parent alcohol nor any other detectable impurity. Conductivity measurements proved the absence of acid impurities. Distillation under reduced pressure (7 Torr) failed because of decomposition of the trifluoroacetate (lit. ${ }^{(\mathrm{S} 6)}$ : bp $93{ }^{\circ} \mathrm{C} / 2.5$ Torr). ${ }^{1} \mathrm{H}$ NMR (300 MHz, $\mathrm{CDCl}_{3}$ ): $\delta=7.05\left(\mathrm{~s}, 1 \mathrm{H}, \mathrm{Ar}_{2} \mathrm{CH}\right), 7.41(\mathrm{~s}, 10 \mathrm{H}, \mathrm{ArH}) .{ }^{13} \mathrm{C} \operatorname{NMR}\left(75.5 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=$ $81.0\left(\mathrm{Ar}_{2} \mathrm{CH}\right), 127.1,128.8,137.9(\mathrm{Ar})$.
4-Fluorobenzhydryl trifluoroacetate was obtained from 4-fluorobenzhydrol ( $2.00 \mathrm{~g}, 9.90 \mathrm{mmol}$ ) and trifluoroacetic anhydride $(2.70 \mathrm{~g}, 12.9 \mathrm{mmol})$ by following the procedure used for preparation of benzhydryl trifluoroacetate: $2.10 \mathrm{~g}(5.11 \mathrm{mmol}, 52 \%) .{ }^{1} \mathrm{H} \mathrm{NMR}\left(300 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=6.97(\mathrm{~s}, 1 \mathrm{H}$, $\left.\mathrm{Ar}_{2} \mathrm{CH}\right), 7.05\left(\mathrm{t}, 2 \mathrm{H}, J_{\mathrm{H}, \mathrm{F}}=17.2 \mathrm{~Hz}, \mathrm{ArH}\right), 7.23-7.41(\mathrm{~m}, 7 \mathrm{H}, \mathrm{ArH})$.

4-Methylbenzhydryl trifluoroacetate was obtained from 4-methylbenzhydrol ( $1.50 \mathrm{~g}, 7.58 \mathrm{mmol}$ ) and trifluoroacetic anhydride $(1.70 \mathrm{~g}, 8.10 \mathrm{mmol})$ by following the procedure used for preparation of benzhydryl trifluoroacetate: $1.40 \mathrm{~g}(3.44 \mathrm{mmol}, 45 \%) .{ }^{1} \mathrm{H}$ NMR ( $300 \mathrm{MHz}, \mathrm{CDCl}_{3}$ ): $\delta=2.34(\mathrm{~s}, 3 \mathrm{H}$, $\mathrm{Me}), 6.97\left(\mathrm{~s}, 1 \mathrm{H}, \mathrm{Ar}_{2} \mathrm{CH}\right), 7.11-7.38(\mathrm{~m}, 9 \mathrm{H}, \mathrm{ArH}) .{ }^{13} \mathrm{C} \operatorname{NMR}\left(75.5 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=21.0\left(\mathrm{ArCH}_{3}\right)$, $80.9\left(\mathrm{Ar}_{2} \mathrm{CH}\right), 126.8,127.0,128.7,129.4,134.8,137.9,138.7$ (Ar)
4,4'-Dimethylbenzhydryl trifluoroacetate was obtained from 4,4'-dimethylbenzhydrol ( 2.00 g , 9.43 mmol ), and trifluoroacetic anhydride ( $2.00 \mathrm{~g}, 9.53 \mathrm{mmol}$ ) by following the procedure used for preparation of benzhydryl trifluoroacetate. After removal of the solvent under reduced pressure, the crude product was washed with small amounts of hexane: $1.38 \mathrm{~g}(5.73 \mathrm{mmol}, 61 \%) .{ }^{1} \mathrm{H}$ NMR ( 300 $\left.\mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=2.30(\mathrm{~s}, 6 \mathrm{H}, 2 \times \mathrm{Me}), 6.94\left(\mathrm{~s}, 1 \mathrm{H}, \mathrm{Ar}_{2} \mathrm{CH}\right), 7.16(\mathrm{~d}, 4 \mathrm{H}, J=8 \mathrm{~Hz}, \mathrm{ArH}), 7.24(\mathrm{~d}, 4 \mathrm{H}$, $J=8 \mathrm{~Hz}, \mathrm{ArH}) .{ }^{13} \mathrm{C} \operatorname{NMR}\left(75.5 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta=21.0(\mathrm{Me}), 80.9\left(\mathrm{Ar}_{2} \mathrm{CH}\right), 126.9,129.3,134.9$, 138.5 (Ar)

4-Methoxybenzhydryl trifluoroacetate. 4-Methoxybenzhydryl trifluoroacetate was obtained from 4methoxybenzhydrol and trifluoroacetic anhydride dissolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. This ester was not isolated because it decomposed during removal of the solvent. It was stable, however, in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ even after washing with aqueous $\mathrm{NaHCO}_{3}$. For the kinetic measurements, samples were taken directly from the $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ solution after washing with $\mathrm{NaHCO}_{3}$ and drying with $\mathrm{Na}_{2} \mathrm{SO}_{4}$. Conductivity of the kinetic solutions after injection of the sample proved the absence of acid impurities, and kinetic curves for the both $90 \%$ aqueous acetone, and $100 \%$ ethanol followed first-order kinetics.

4,4'-Dimethoxybenzhydryl 3,5-dinitrobenzoate. A solution of 4,4'-dimethoxybenzhydrol ( 1.50 g , $6.15 \mathrm{mmol})$, 3,5-nitrobenzoyl chloride ( $1.64 \mathrm{~g}, 7.11 \mathrm{mmol}$ ), and pyridine ( $1.17 \mathrm{~g}, 14.80 \mathrm{mmol}$ ) in benzene ( 100 mL ) was stirred under Ar atmosphere at ambient temperature for 15 h . ## Kinetics of Solvolysis Reactions

Solvolysis rates of benzhydrylium derivatives (Tables 1 and S1) were monitored by following the increase of the conductivity of the reaction mixtures (conductimeters: WTW LF530 or Tacussel CD 810, Pt electrode: WTW LTA $1 / \mathrm{NS}$ ). ${ }^{[13]}$ Freshly prepared solvents ( 30 mL ) were thermostated ( $\pm 0.1$ ${ }^{\circ} \mathrm{C}$ ) at the given temperature for 5 min prior to adding the substrate. Typically, 20 to 70 mg of substrate was dissolved in $100-150 \mu \mathrm{~L}$ of $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ and injected into the solvent, and the conductance $(G)$ was recorded at given time intervals.
The first order rate constants $k\left(\mathrm{~s}^{-1}\right)$ were obtained by least squares fitting of the conductance data to a single-exponential equation $G_{\mathrm{t}}=G_{0} \exp (-k t)+C$. Each rate constant was averaged from at least three kinetic runs.

Most solvolyses were performed at $25^{\circ} \mathrm{C}$. Slower kinetics were followed at three or more different higher temperatures, and the rate constants were extrapolated to $25^{\circ} \mathrm{C}$. Faster kinetics were followed at lower temperatures.
Calibrations showed linear relationships between conductance and the concentrations of liberated HCl , $\mathrm{HBr}, \mathrm{TsOH}$. In the case of 4-nitrobenzoate, 3,5-dinitrobenzoate, and trifluoroacetate appropriate base, which ionized liberated acid well enough to give linear response between conductance and concentration of the ions, was added to the kinetic mixture. 2,6-Lutidine was employed for ionizing trifluoroacetic acid in $90 \mathrm{~A} 10 \mathrm{~W}, 80 \mathrm{~A} 20 \mathrm{~W}$, E, 80E20W, and 3,5-dinitrobenzoic acid in 80 E 20 W . Triethylamine was employed for ionizing 4-nitrobenzoic acid in 80 E . Proton sponge [= 1,8-bis-(dimethylamino)-naphthalene] was used for ionizing 3,5-dinitrobenzoic acid in 90A10W, 80A20W, and E . Measuring the standard chlorides from the literature showed that the solvent ionizing power was not affected by added base.

Solvents were purified and dried according to the standard procedures.
